

Assignment V | Group 23

Cenhan Du Korin Hoxha Alberto Perez

We have implemented our CD by setting up the home page and imprint page, while establishing a set of placeholders for the various parts of our web page. In the CSS files we have captured as many of our CD settings as possible, while our HTML body files only contain contents and structure, but no layout information. Now we start to get more succinct in our project's purpose. We decided to go as a company that rents out musical instruments.

1. [Home.html / style.css](#)

In this cascade sheet we have styled the different components of our Home.html file.

Our page has three sections:

Section 1: That would be our banner where we give a short info for our company. It contains: A navigation bar with the categories of the instruments we are renting out and the shopping-cart, the user logo where the user should log-in, the company's (Kordeebeto) logo and a sidebar that is supposed to connect to our company's social media accounts. The background is an image with a gradient overlay.

Section 2: Serves as an indicator of what we are renting and further in the project each overlaid image (which is overlaid with its category and a gradient layer with every mouse hover).

Section 3: That is the footer section that has our company's contact and our opening hours. At the bottom left we also have the link to our imprint page.

2. [Imprint.html / imprint_style.css](#)

This html page contains our required contacts, our logo, a footer and disclaimer given in our assignment sheet. In the cascade sheet we are simply styling the fonts, the background color and footer.
